ECE 155 Winter 2015 1/26

Java for C# Programmers

The labs this semester will require you to write Java code for the Android platform, yet you learned C# in ECE 150.

Fortunately, there are a lot of similarities between Java and C#, so you should have a smooth transition.

As it says in the syllabus, please take some time at the beginning of the term to get caught up on Java.

ECE 155 Winter 2015 2/2

Java: Object Oriented

Java is an object-oriented programming language:

- Every piece of data is encapsulated in some object.
- Every executable statement is in some method.
- Every object is an instance of a class (or is an array).

ECE 155 Winter 2015 3/2i

Java Types

Java has eight primitive (basic) types. Every variable will be one of the primitive types or a reference to a Java object.

A reference may be null or contain the address of an instance of an object.

ECE 155 Winter 2015 4/26

The Eight Basic Types

The eight basic types are:

- 1 boolean
- 2 char
- 3 byte
- 4 short
- 5 int
- 6 long
- 7 float
- 8 double

ECE 155 Winter 2015 5/26

Floating Point Special Values

Note that in addition to their normal values, the floating point types have some extra weird values:

NEGATIVE_INFINITY, POSITIVE_INFINITY, and NaN.

These special values result from operations that go out of range or make no mathematical sense.

ECE 155 Winter 2015 6/2

Java Types

The common types you're likely to use are boolean, int, and double (in the labs, float gets a fair amount of use).

You have no doubt noticed that String does not appear.

It's not a simple type; it's a reference to an array of characters.

ECE 155 Winter 2015 7/2

```
Declare a String as null, like this: String s = null;.
```

Strings are immutable: once created, they don't change.

If you add to a String or replace characters in it, you get a new String back and not the old one.

```
Example: string1.replaceAll('?', '.'), \rightarrow assign the result string1 = string1.replaceAll('?', '.')
```

ECE 155 Winter 2015 8/26

The equality operator == can behave strangely on Strings.

```
Use the equals method:
   if (string1.equals(string2)) { ... } .
```

ECE 155 Winter 2015 9/26

Wrapper Classes

Java also provides wrapper classes for the primitive types.

Work with them as if they were regular objects.

The wrapper class for int: Integer

(Mostly, just capitalize the first letter).

ECE 155 Winter 2015 10/26

Complex Objects

Just like in C# you create them in classes.

To create an instance of that class you use the new keyword.

Example: Integer example = new Integer(20);.

The new keyword invokes the class Constructor.

ECE 155 Winter 2015 11/26

Java Semantics

Java does not have structs; classes only.

Frequently asked questions: there are no pointers or delegates.

Java uses *Garbage Collection*. No freeing up or de-allocating objects that are no longer needed.

This prevents the extremely common error of trying to use some object/memory that has been released.

ECE 155 Winter 2015 12/26

Imperative Constructs

c) in Java.

However, C#'s foreach (type t in c) is instead for (Type t :

ECE 155 Winter 2015 13/

Methods work the same way also:

```
modifiers returnType methodName(param-list) {
   T1 t; returnType r;
   ...
   return r;
}
```

When you call a method on an object, you still use the . between the object and the method, such as t.toString().

In C#, the method name convention is
UppercaseFirstLetter(), while in Java, it is
lowercaseFirstLetter().

ECE 155 Winter 2015 14/26

Simple Unit Converter: C#

ECE 155 Winter 2015 15/26

Simple Unit Converter: Java

```
class FootConverter {
  static double convertFeetToMeters(double feet) {
    return feet / 3.28;
  }
  public static void main(String[] s) {
    System.out.printf("%s ft is %.2f m.\n", s[0],
        convertFeetToMeters(Double.parseDouble(s[0])));
  }
}
```

ECE 155 Winter 2015 16/26

Arrays & Collections

The simple array is created with the [] square brackets.

Example: int[] numbers = new int[10];

You can have null elements in an array (say, of Strings) without this affecting the array length.

An array is technically an object so you can assign it where a generic Object is expected.

ECE 155 Winter 2015 17/26

Multidimensional arrays are also allowed, but only for primitive types int[][][] coordinates = new int[5][10][2];.

This is not a big restriction because you can just have an array of arrays.

Unlike C# though, you can't specify a rectangular array.

ECE 155 Winter 2015 18/26

This is great, but like the String the explicit array is of fixed size.

Create a new, bigger one if you needed it and copy all the data to the bigger one...?

Allocate an array of capacity 999 when we aren't sure how many we'll need?

Wouldn't it be nice if we had a dynamic collection?

ECE 155 Winter 2015 19/26

Java Collections

In Java, we do, and they're called, Collections.

The most common one: the List.

The type List takes a parameter in angle brackets to tell you what this is a list of.

Example: List<String>.

ECE 155 Winter 2015 20/26

Note that you can't call new List<String>() because no constructor exists for just plain List.

Be specific about what kind of list you want to have, such as ArrayList (a very common one) or LinkedList.

ECE 155 Winter 2015 21/26

Three Basic Collections

Three basic collections exist:

- 1 List
- 2 Map (in a later lecture)
- 3 Set (like a list, but no duplicates)

ECE 155 Winter 2015 22/26

Your First Java Program: C# Equivalent

```
using System;

class C {
   static void Main() {
      Console.WriteLine("Hello, world!");
   }
}
```

ECE 155 Winter 2015 23/26

Your First Java Program

```
class C {
  public static void main(String[] argv) {
    System.out.println("Hello, world!");
  }
}
```

ECE 155 Winter 2015 24/26

Logging for Android

Android tip: System.out.println() is great for debugging console applications, but doesn't work on Android.

$$Log.d("tag", "i = "+i);$$

This writes out a debug (d) logging message, which appears e.g. in your Eclipse LogCat window.

You can then filter out logging messages by level or tag, so that you only see the ones you're interested in.

ECE 155 Winter 2015 25/26

Eclipse Demo

Now we'll open up Eclipse and create some basic Java programs. We can take a look at the syntax of Java in simple situations.

ECE 155 Winter 2015 26/26
