ECE 155 Winter 2016 2/2

A simulation evaluates a mathematical model of a system to estimate the behaviour of the system.

ECE 155 Winter 2016 3/26

It's never as good as the real thing. But:

It's never as good as the real thing. But:

ECE 155 Winter 2016 4/26

It's never as good as the real thing. But:

ECE 155 Winter 2016 4/26

Models are Inherently Wrong

...essentially, all models are wrong, but some are useful.

George E. P. Box

ECE 155 Winter 2016 5/26

Models are Inherently Wrong

Simulation is an abstraction and not as detailed as reality.

 π has an infinite number of digits. After the first thousand digits, the error introduced by rounding is so small it has no relevance for architectural calculations.

How much is "enough" is a matter of engineering judgement.

ECE 155 Winter 2016 6/2

Model Validity

Critical element: models have a range of validity.

This range must be respected if the model is useful.

Outside the range, the model is useless or misleading.

ECE 155 Winter 2016 7/26

Model Validity Example: Physics

Newton's equations are valid at speeds below 0.1c. Where c is the speed of light in a vacuum.

In that range, the error is small and can be ignored.

If you try to apply it at speeds of 0.5c, your answer is wrong.

Instead, use Einstein's equations as the model.

They have a different (larger) range of validity.

Key point: understand the model's limitations.

ECE 155 Winter 2016 8/26

The Map and the Territory

The map is not the territory.

Alfred Korzybski

ECE 155 Winter 2016 9/26

The Map and the Territory

Don't confuse the map (abstraction) and territory (reality).

The model can be helpful, but don't overdo it.

Don't spend all your time modelling or studying model output.

Also take time to understand the real challenges.

ECE 155 Winter 2016 10/26

The Map and the Territory: Example

A literal example of the map and territory: Canada-US Border.

West of Ontario, the border drawn on most maps as being exactly the 49th parallel.

This is, however, wrong.

ECE 155 Winter 2016 11/26

The Map and the Territory: Example

Surveyors placed small monuments at discrete distances.

The border is legally the series of line segments connecting these monuments.

Given the level of technology available at the time of measurement, these are not in a perfectly straight line.

ECE 155 Winter 2016 12/2i

The Map and the Territory: Example

Even a map representing those is wrong.

Shrinking thousands of kilometres of country down to centimetres will introduce error and inaccuracy.

How small can you print the dots marking the monuments?

ECE 155 Winter 2016 13/26

Case studies

ECE 155 Winter 2016 14/26

Create a set of classes:

class Board: says whether the class is black or white at a point.

ECE 155 Winter 2016 15/2

Create a set of classes:

class Robot: simulates the position and velocity of the robot; contains main logic.

ECE 155 Winter 2016 15/2i

Create a set of classes:

■ class LightSensor: provides an interface between the Robot and the Board.

ECE 155 Winter 2016 15/26

Coding the Coarse Simulation

You'd provide a main simulation driver, which calls the Robot to:

- update its position according to its velocity;
- turn the robot if necessary.

Each call to the Robot's update simulates the effect of time moving forward by one time-step.

ECE 155 Winter 2016 16/26

Detailed Simulation: Visual Simulation Environment

Implements physics. Calls your actual code.

ECE 155 Winter 2016 17/26

Paraphrased: "Everything worked fine in simulation, but needed lots more work in reality."

ECE 155 Winter 2016 18/26

Other Simulation Examples

Use discrete techniques: gates change values at specific times, in response to changing inputs.

ECE 155 Winter 2016 19/26

Other Simulation Examples

BASIC MAGNETOMETER CIRCUIT

Analog circuit: continuous techniques.

Techniques for simulation

- Discrete: use an event queue.
- Continuous: numerically integrate an ordinary differential equation repeatedly (ECE204).

ECE 155 Winter 2016 21/26

Classifying simulations: Three axes

ECE 155 Winter 2016 22/26

Discrete versus Continuous

- Discrete: time steps ahead in increments (e.g. finite state machine)
- Continuous: evaluate at discrete times, but system has values at all times.

ECE 155 Winter 2016 23/26

Dynamic versus Static

- Dynamic: system evolves over time; recomputes state.
- Static: one-shot deal (e.g. what-if simulations).

ECE 155 Winter 2016 24/26

Deterministic versus Stochastic

- Deterministic: exactly computes state at every step
- Stochastic: uses randomness to guess expected behaviour (with high accuracy).

ECE 155 Winter 2016 25/26

Simulation Tools

Some examples:

- Microsoft Visual Simulation Environment: MS robotics.
- *Arena*: businesses, services, and manufacturing processes.
- *Simulink*: time-varying systems, e.g. communications, controls, signal processing, video processing, and image processing.
- SPICE & variants: analog circuits.

Also: simulator-building languages.
