Lecture 5 - XML, Android, IDEs

Patrick Lam & Jeff Zarnett p.lam@ece.uwaterloo.ca & jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

December 29, 2014

ECE 155 Winter 2015 1/30

Part I

XML

ECE 155 Winter 2015 2/30

eXtensible Markup Language

You need to know a bit about XML (eXtensible Markup Language) to build Android applications

By the way, this is examinable material.

For further reading, you can consult many resources on the Web. Here's one:

http://www.w3schools.com/xml/default.asp

ECE 155 Winter 2015 3/

XML in one Line

XML is a structured document format.

ECE 155 Winter 2015 4/30

Structured Document Format

All XML documents therefore have the same format.

XML has no intrinsic meaning.

It just separates content from structure.

It is meant to be human-readable/writable.

If you are familiar with HTML, there are a number of similarities, but XML is more general.

ECE 155 Winter 2015 5/3

XML Document Terminology

Every XML document begins with
<?xml version="1.0" encoding="utf-8"?>

Documents have tags, which appear between angle brackets: <example>

Tags are opened and closed, so that tag must be followed by </example>, which closes the example tag.

We can also have "self-closing" tabs, (notational convenience) such as <approval />.

A tag may also have attributes, like colour in this example: <square colour="red"/>.

ECE 155 Winter 2015 6/3

XML Parsing

XML is intended to be human-readable and human writeable.

Computers can read and comprehend XML by "parsing" the document.

There are a number of well-known XML parsers.

Use one of them if you need to programmatically examine some XML and do not write your own.

ECE 155 Winter 2015 7/3

Android Manifest

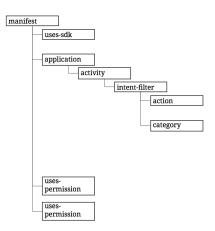

Example XML Document: Android Manifest.

(Shown from the notes because it's too large for slides).

ECE 155 Winter 2015 8/30

XML Tree Structure

XML is tree-structured: at the top level, there is a *root* element. We can convert the textual form into a tree.

ECE 155 Winter 2015 9/30

Part II

Android Programming

ECE 155 Winter 2015 10/30

Android: Introduction

By now you have no doubt taken a look at the labs.

You need to implement them using Android, either on your own phone or one of the devices we provide in the labs.

We will take some time to introduce you to Android programming.

ECE 155 Winter 2015 11/30

Android: Activity

"An activity is a single, focused thing that the user can do."

Usually, an Activity corresponds to a full-screen window which the user may interact with. For instance, the user may:

- set up a timer;
- read off sensor values; or
- make a phone call.

ECE 155 Winter 2015 12/30

Android: Activity

Applications may contain multiple activities, each of which corresponds to a thing that the user wants to do.

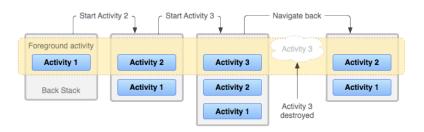

Android organizes activities into tasks.

A task consists of a last-in, first-out stack of activities, possibly from different applications.

ECE 155 Winter 2015 13/30

The Back Button

The Back button pops the topmost activity off the stack and gets rid of it.

ECE 155 Winter 2015 14/30

It is also possible to switch between tasks.

Switching tasks puts a different activity and its stack in the foreground, and puts the old activity in the background.

ECE 155 Winter 2015 15/30

Doing Something in the Activity

You'll be writing a lot of code in onCreate().

It gets executed when the activity starts.

Typically, it will set up the user interface, namely:

- creating widgets;
- setting up event listeners;

Note that you must call **super.onCreate()**.

This is done for you in the autogenerated boilerplate code.

ECE 155 Winter 2015 16/30

Retrieving Widgets

If you've declared widgets in the XML file, you can use the **findViewById()** method to get a hold of them.

Note:

■ you need to cast the return value, e.g.

```
tv = (TextView) findViewById(R.id.t);
```

■ you must save the XML file to get the right ids on the R object.

ECE 155 Winter 2015 17/30

Programmatically Adding Widgets

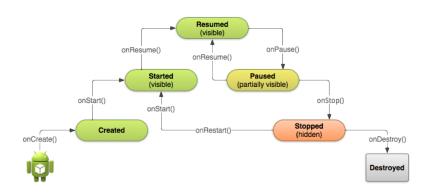

We ask you to add widgets programmatically in Lab 1. There are two steps:

```
1 Create the widget: tv = new
   TextView(getApplicationContext());
2 Add it to the Activity: addView(tv);
```

ECE 155 Winter 2015 18/30

Activity Lifecycle

Although we've only talked about onCreate(), there are numerous other methods on Activity which Android calls at various times.

ECE 155 Winter 2015 19/30

Part III

Integrated Development Environments

ECE 155 Winter 2015 20/30

In the Dark Ages

Write code in editor (vi, emacs, notepad.exe)

Invoke command-line compiler

Can we make better tools? Yes: IDE!

ECE 155 Winter 2015 21/30

Contains:

- editor, plus
- compiler, plus
- debugger

Integrated into a single environment.

ECE 155 Winter 2015 22/3

The Eclipse IDE

Eclipse is a fully-featured modern IDE.

Notes:

- runs on Linux, Mac, Windows;
- it is free software: you can extend and modify it;
- initially developed by IBM Ottawa.

ECE 155 Winter 2015 23/30

Beyond Core IDE Components

Eclipse (and other IDEs) also support:

- revision control systems (you've used this);
- documentation and modelling (e.g. UML);
- autocomplete and refactoring.

ECE 155 Winter 2015 24/30

Syntax Highlighting

```
// This file must exist first!
private static File outputFile = new File("files/mkdir.txt");

/**
    * @param args
    * @throws IOException
    */
public static void main(String[] args) throws IOException {
    BufferedWriter bw = new BufferedWriter(new FileWriter(outputFile));
```

ECE 155 Winter 2015 25/30

Syntax Highlighting

```
// This file must exist first!
private static File outputFile = new File("files/mkdir.txt):
```

ECE 155 Winter 2015 26/30

Templates

IDEs often allow you to start your project from a template; easier than starting from scratch

- Android Test Project (you'll use these);
- Java Project
- Java Class
- Java Interface

ECE 155 Winter 2015 27/30

Continuous Compiling

```
// This file must exist first!
private static File outputFile = new File("files/mkdir.txt):
```

Notice the red squiggle under the error.

ECE 155 Winter 2015 28/30

Project Development Workflow

- Figure out what you'll need to do.
- Start a new project from a template or, more realistically, check it out from a version control repository.
- Make the edits that you need.
- **Test your edits by running the application.**
- Debug your edits.
- **S** Commit your files to the version control repository.

ECE 155 Winter 2015 29/3

Eclipse demo

We'll show a little demo of Eclipse (time permitting):

- Create a new project from a template.
- Go over syntax highlighting.
- Show you content assist.
- Demonstrate the "Quick Fix" feature.
